Internet Safety!

The Internet is something that we all use everyday! We can search the web or go on social network sites or just browse the Internet! Whatever we do we are still vulnerable to certain people especially on Social Network sites. Certain people use these sites to their advantage to contact younger people and communicate with them. The younger people may not know who they are talking to and so that is why younger people are more vulnerable on social network sites!

Social Network sites are a big part of Internet Safety. These sites have privacy settings to stop cyber-bulling and to stop people seeing your personal information. If the privacy settings are set incorrectly then people you don't know can see your personal information and contact you if you have your mobile number or email address visible to others! Social Network sites do give you the option about privacy settings but those are not controlled by the site but they are controlled by you! This is why on social network sites you must set the privacy settings correctly! The same on YouTube! The privacy settings must be correct!

Internet Safety is something that is taken very seriously in this day and age! The Internet can be a dangerous place at times. If you don't have the correct settings on social network sites people can access all your personal information and can contact you if you have mobile numbers and email address visible.
